五大连池简介 Introduction for Wudalianchi

- 五大连池位于黑龙江省黑河市。
In Heilongjiang province
- 在过去200万年间经历了7次大规模的火山喷发。
7 times of large-scale volcanic eruption here in last 2 million years
- 形成了14座不同历史年代(200万年—290年前)的火山。
14 volcano types in different periods
- 是中国保存最为完好的内陆火山遗迹。
The best-preserved inland volcano relic in China

Criterion IX

Containing continuing ecological succession and the formation of new assemblies of plants and animals.

“是反映陆地生态系统和动植物群落进化和发展进程中正在进行的生态和生物演化过程的杰出范例。”

Criterion VIII

As it clearly contains examples of very recent and older volcanism, combined in an unusual setting (mid-continent). The presence of very recently formed lakes contributes to the geomorphologic interest.

植物的丰富性和多样性

Diversity and abundance in Plant

五大连池位于大兴安岭寒温带落叶针叶林区系和小兴安岭温带针阔混交林植被区系交界处，是典型的生态交错区，增强了其多样性。

Wudalianchi is located within the ecotone between the Great Hinggan Mountains, the Less Hinggan Mountains and the forest steppes of the Songnen Plain. There are intersecting geographic characters of vegetation, extensive floral components and high relative species richness.

五大连池是独立的大陆火山地，跨越了一些生物地理区域，具有丰富的生境多样性（很多火山，不同年代的熔岩，古老的地表，其它火山地面，湿地和湖泊等），因此增强了其多样性。

The WDLC is an isolated continental volcanic field that happens to straddle several biogeographic zones. The extreme habitat diversity (many volcanoes, lava of many ages, other volcanic surfaces, presence of very ancient surfaces not by lava, wetlands, lakes, etc.) , leads to relatively high species richness.

植被演替的原生性与完整性

The primary and the integrity of vegetation succession

As the primary succession caused by the volcanic eruption is a little bit complex, and it is required to have stages such as the lichen - moss - herb - shrub – tree in the lava bare ground, due to moisture and weathering in exposed lava, the succession to the climax community need hundreds of years' or even millions of years' evolutionary process.

Volcanic plant functional traits and diversity

研究目的与意义

Purpose and significance

对五大连池不同历史年代火山植物演化和植被演替过程的研究，试图揭示200万年以来植物演化和生态演替过程、及其环境协同机制，为温带大陆环境火山植物和植被的演替提供重要的科学依据。

The research try to reveal the plants and vegetation evolutionary history in the 200 000 years, which provid important scientific evidence for the evolution of plants and vegetation in temperate continental environment under primary succession by volcanic eruption.

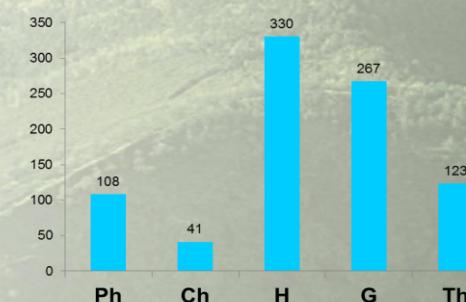

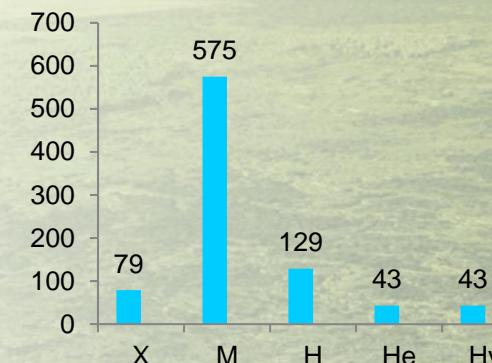

研究结果 Results

五大连池植物种类及组成

Plant species and composition in WDLC

- 植物组成
Plant species composition
- 生活形特征
Plant life form characteristics
- 生态型特征
Plant ecotype characteristics
- 植物属的分布
Distribution types of genera

	family	% in family	genus	% in genus	specie	% in specie
Gymnosperm	2	2.02	5	1.36	7	0.81
Angiosperm	Dicotys	78	78.79	281	671	77.22
	Monocots	19	19.19	83	191	21.98
In all		69	100	369	869	100

研究结果 Results

火山植物多样性及环境协同性

volcanic vegetation diversity and environmental synergy

利用“空间代替时间”的研究方法，对不同历史年代火山植物及植被恢复进行研究，物种多样性的变化规律符合“中间干扰假说”。

By “space replacing time” method, volcanic plants and vegetation restoration in different time was studied, the change rule of species diversity is fit for “The intermediate disturbance hypothesis”.
